Note:
1. If the OB is close to a ball off the cushion, the system works very well at most angles.

2. Use slow-medium speed. If slower or faster speed is required, adjust the aim slightly (closer to the ball for faster speed, and farther from the ball at slower speed).

3. When the OB is closer than a ball away, adjust the aim closer to the ball; and when the OB is farther than a ball away, adjust the aim farther from the ball. Move the aim point along the rail about twice the distance the OB is from the 1-ball-off-the-cushion position.
