This technique is from Bob Jewett's January, 2021 Billiards Digest column. If you pivot the cue 90deg about a certain point along the aiming line, with the tip starting at the ghost ball, a line through the butt of the cue and the ghost-ball will point in the final CB direction for a rolling-CB shot.

standard cue length:
$\mathrm{c}:=58 \cdot \mathrm{in}$

The CB deflection angle $\left(\theta_{\mathrm{C}}\right)$ is related to the pivot point $(\mathrm{x})$ and cue length (c) with:

$$
\tan \left(\theta_{c}\right)=\frac{(c-x)}{x}
$$

So the required pivot point to create a known CB deflection angle is:

$$
x\left(\theta_{c}\right):=\frac{c}{\tan \left(\theta_{c}\right)+1}
$$

Using the CB deflection angles $\left(\theta_{\mathrm{c}}\right)$ for standard ball-hit-fractions (f) from page 8 in TP A.6, the required pivot distances from the tip for a standard-length cue are:

$$
\begin{array}{lll}
\mathrm{f}:=\frac{1}{2} & \theta_{\mathrm{c}}:=34 \cdot \mathrm{deg} & \mathrm{x}\left(\theta_{\mathrm{c}}\right)=34.6 \cdot \mathrm{in} \\
\mathrm{f}:=\frac{1}{4} & \theta_{\mathrm{Ma}}:=27 \cdot \mathrm{deg} & \mathrm{x}\left(\theta_{\mathrm{c}}\right)=38.4 \cdot \mathrm{in} \\
\mathrm{f}:=\frac{3}{4} & \theta_{\mathrm{Ma}}:=28 \cdot \operatorname{deg} & \mathrm{x}\left(\theta_{\mathrm{c}}\right)=37.9 \cdot \mathrm{in}
\end{array}
$$

30 degree rule average:

$$
\begin{gathered}
\theta_{a}:=30 \cdot \mathrm{deg} \\
x\left(\theta_{c}\right)=36.8 \cdot \mathrm{in}
\end{gathered}
$$
