originally posted: 2/21/2009 last revision: 7/10/2011

In the analysis below, I will begin by assuming the balls and tip are perfect ( $e_{b}=1.0, \mu_{b}=0$, $\left.\eta_{\text {tip }}=100 \%\right)$, but I will account for these effects later. With perfect balls, $v=0, \omega^{\prime \prime}=-\omega^{\prime}$, and $v_{O B}=v^{\prime}$.

Relevant physical parameters (from "physics" FAQ):

$$
\begin{array}{ll}
\mu_{\mathrm{s}}:=0.2 & \text { typical ball-cloth coefficient of sliding friction } \\
\mu_{\mathrm{r}}:=0.01 & \text { typical ball-cloth coefficient of rolling resistance } \\
\mathrm{R}:=1.125 \cdot \text { in } & \text { ball radius: } \\
\mathrm{m}_{\mathrm{r}}:=\frac{6}{19} & \text { typical ball-mass-to-cue-mass ratio }\left(\mathrm{m}_{\mathrm{b}} / \mathrm{m}_{\mathrm{s}}\right): \\
\mathrm{e}_{\mathrm{b}}:=1 & \text { ball-to-ball coefficient of restitution (assumed perfectly elastic) } \\
\mu_{\mathrm{b}}:=0.06 & \text { ball-to-ball coefficient of friction (varies with ball surface speed) }
\end{array}
$$

From TP A.30, the CB speed (v) and spin ( $\omega$ ) resulting from cue speed $v_{s}$ and tip offset $b$, assuming a perfect tip, are:

$$
\mathrm{v}\left(\mathrm{v}_{\mathrm{s}}, \mathrm{~b}\right):=\frac{2 \cdot \mathrm{v}_{\mathrm{s}}}{\left[1+\mathrm{m}_{\mathrm{r}}+\frac{5}{2} \cdot\left(\frac{\mathrm{~b}}{\mathrm{R}}\right)^{2}\right]} \quad \omega\left(\mathrm{v}_{\mathrm{s}}, \mathrm{~b}\right):=-\frac{5}{2} \cdot \mathrm{v}\left(\mathrm{v}_{\mathrm{s}}, \mathrm{~b}\right) \cdot \frac{\mathrm{b}}{\mathrm{R}^{2}}
$$

## Note $\mathbf{- \omega < 0}$ implies backspin; $\omega>0$ implies topspin or forward roll

From TP 2.1, the safe miscue limit is generally assumed to be:

$$
\mathrm{b}_{\max }:=\frac{\mathrm{R}}{2}=0.563 \cdot \mathrm{in} \quad \mathrm{~b}:=0,0.05 \cdot \mathrm{~b}_{\max } \cdot \cdot \mathrm{b}_{\max }
$$

Based on TP B.6, typical draw shot CB speeds (which are higher than other shots) are probably in the following range:

$$
\mathrm{v}_{\text {slow }}:=8 \cdot \mathrm{mph} \quad \mathrm{v}_{\text {medium }}:=10 \cdot \mathrm{mph} \quad \mathrm{v}_{\text {fast }}:=14 \cdot \mathrm{mph} \quad \mathrm{v}_{\text {power }}:=19 \cdot \mathrm{mph}
$$

From the equation above for ball speed, these correspond to center-ball-hit cue speeds of:

$$
\mathrm{v}_{\mathrm{s}}(\mathrm{v}):=\frac{\left(1+\mathrm{m}_{\mathrm{r}}\right)}{2} \cdot \mathrm{v}
$$

$$
\begin{array}{ll}
\mathrm{v}_{\mathrm{S} \_ \text {slow }}:=\mathrm{v}_{\mathrm{s}}\left(\mathrm{v}_{\text {slow }}\right)=5.263 \cdot \mathrm{mph} & \mathrm{v}_{\mathrm{s} \_ \text {medium }}:=\mathrm{v}_{\mathrm{s}}\left(\mathrm{v}_{\text {medium }}\right)=6.579 \cdot \mathrm{mph} \\
\mathrm{v}_{\mathrm{s} \text { _fast }}:=\mathrm{v}_{\mathrm{s}}\left(\mathrm{v}_{\text {fast }}\right)=9.211 \cdot \mathrm{mph} & \mathrm{v}_{\mathrm{s} \_ \text {power }}:=\mathrm{v}_{\mathrm{s}}\left(\mathrm{v}_{\text {power }}\right)=12.5 \cdot \mathrm{mph}
\end{array}
$$

Here is how the cue ball speed varies with tip offset for a given cue speed, assuming a perfect tip:

$$
\frac{\mathrm{v}\left(\mathrm{v}_{\mathrm{s} \_ \text {medium }}, 0\right)}{\mathrm{v}_{\mathrm{s} \_ \text {medium }}}=152 \cdot \%
$$

$$
\frac{\mathrm{v}\left(\mathrm{v}_{\mathrm{s} \_ \text {medium }}, \mathrm{b}_{\text {max }}\right)}{\mathrm{v}_{\mathrm{s} \_ \text {medium }}}=103.051 . \%
$$

So with a center-ball hit, assuming a perfect tip, the CB speed is about $50 \%$ more than (3/2-times) the cue speed; and at a maximum offset shot, the CB and original cue speeds are nearly equal.

Here is how the cue ball spin varies with tip offset for a given cue speed:

So, assuming a perfect tip, more tip offset always gives you more spin, but the increase in spin isn't as great with increasing offset. The spin at maximum offset is only about $50 \%$ faster than the spin at half the maximum offset, and only about $5 \%$ than the spin at $90 \%$ maximum offset.

From TP 4.1, the CB speed and spin change during drag over distance x on the way to the OB according to:

$$
\begin{gathered}
\mathrm{v}_{\mathrm{drag}}\left(\mathrm{v}, \mathrm{x}, \mu_{\mathrm{s}}\right):=\sqrt{\mathrm{v}^{2}-2 \cdot \mu_{\mathrm{s}} \cdot \mathrm{~g} \cdot \mathrm{x}} \\
\omega_{\mathrm{drag}}\left(\mathrm{v}, \omega, \mathrm{x}, \mu_{\mathrm{s}}\right):=\omega+\frac{5}{2 \cdot \mathrm{R}} \cdot\left(\mathrm{v}-\sqrt{\mathrm{v}^{2}-2 \cdot \mu_{\mathrm{s}} \cdot \mathrm{~g} \cdot \mathrm{x}}\right)
\end{gathered}
$$

From TP 4.1, the distance required for stun to develop (for $\omega<0$ ) is:

$$
\mathrm{d}_{\text {stun }}\left(\mathrm{v}, \omega, \mu_{\mathrm{s}}\right):=\frac{2 \cdot \mathrm{R} \cdot(-\omega)}{5 \cdot \mu_{\mathrm{s}} \cdot \mathrm{~g}}\left[\mathrm{v}-\frac{(-\omega) \cdot \mathrm{R}}{5}\right]
$$

From TP B.5, the distance required for a skidding (sliding) CB to develop natural roll, and the speed when roll first develops are:

$$
\begin{gathered}
\mathrm{d}_{\text {skid }}\left(\mathrm{v}, \omega, \mu_{\mathrm{s}}\right):=\operatorname{sign}\left(\frac{\mathrm{v}}{\mathrm{R}}-\omega\right) \cdot \frac{2}{49 \cdot \mu_{\mathrm{s}} \cdot \mathrm{~g}} \cdot\left[6 \cdot \mathrm{v}^{2}-5 \mathrm{v} \cdot \mathrm{R} \cdot \omega-(\mathrm{R} \cdot \omega)^{2}\right] \\
\mathrm{v}_{\text {skid }}(\mathrm{v}, \omega):=\frac{5}{7} \cdot \mathrm{v}+\frac{2}{7} \cdot \mathrm{R} \cdot \omega
\end{gathered}
$$

From TP B.6, the distance required for a rolling ball to come to a stop is:

$$
\mathrm{d}_{\mathrm{roll}}\left(\mathrm{v}, \mu_{\mathrm{r}}\right):=\operatorname{sign}(\mathrm{v}) \cdot \frac{\mathrm{v}^{2}}{2 \cdot \mu_{\mathrm{r}} \cdot g}
$$

and the speed slows during rolling over distance x according to:

$$
\mathrm{v}_{\mathrm{roll}}\left(\mathrm{v}, \mathrm{x}, \mu_{\mathrm{r}}\right):=\sqrt{\mathrm{v}^{2}-2 \cdot \mu_{\mathrm{r}} \cdot \mathrm{~g} \cdot \mathrm{x}}
$$

For a draw shot, where the CB still has backspin at OB impact,

$$
\mathrm{d}_{\text {draw }}=\mathrm{d}_{\text {skid }}\left(-\mathrm{v}^{\prime \prime}, \omega^{\prime \prime}, \mu_{\mathrm{s}}\right)+\mathrm{d}_{\text {roll }}\left(\mathrm{v}^{\prime \prime \prime}, \mu_{\mathrm{r}}\right)
$$

Assuming perfect balls ( $\left.\mathrm{v}^{\prime \prime}=0, \omega^{\prime \prime}=-\omega^{\prime}\right)$,

$$
\begin{aligned}
& \mathrm{d}_{\text {draw }}=\mathrm{d}_{\text {skid }}\left(0,-\omega^{\prime}, \mu_{\mathrm{s}}\right)+\mathrm{d}_{\text {roll }}\left(\mathrm{v}^{\prime \prime}, \mu_{\mathrm{r}}\right) \\
& \omega^{\prime \prime}=-\omega^{\prime}=-\omega_{\text {drag }}\left(\mathrm{v}, \omega, \mathrm{~d}_{\text {drag }}, \mu_{\mathrm{s}}\right) \\
& \mathrm{v}=\mathrm{v}\left(\mathrm{v}_{\mathrm{s}}, \mathrm{~b}\right) \\
& \omega=\omega\left(\mathrm{v}_{\mathrm{s}}, \mathrm{~b}\right) \\
& \mathrm{v}^{\prime \prime \prime}=\mathrm{v}_{\text {skid }}\left(0,-\omega^{\prime}, \mu_{\mathrm{s}}\right)
\end{aligned}
$$

Combining everything gives:

$$
\begin{gathered}
d_{\text {draw }}=d_{\text {skid }}\left(0,-\omega^{\prime}, \mu_{\mathrm{s}}\right)+\mathrm{d}_{\text {roll }}\left(\mathrm{v}^{\mathrm{v} \prime}, \mu_{\mathrm{r}}\right) \\
\mathrm{d}_{\text {draw }}=\frac{2 \cdot\left(\mathrm{R} \cdot \omega^{\prime}\right)^{2}}{49 \cdot \mu_{\mathrm{s}} \cdot g}+\frac{\mathrm{v}^{\prime \prime \prime^{2}}}{2 \cdot \mu_{\mathrm{r}} \cdot g} \\
\mathrm{~d}_{\text {draw }}=\frac{2 \cdot\left(\mathrm{R} \cdot \omega_{\text {drag }}\left(\mathrm{v}, \omega, \mathrm{~d}_{\text {drag }}\right)\right)^{2}}{49 \cdot \mu_{\mathrm{s}} \cdot \mathrm{~g}}+\frac{\mathrm{v}_{\text {skid }}\left(0,-\omega^{\prime}\right)^{2}}{2 \cdot \mu_{\mathrm{r}} \cdot \mathrm{~g}} \\
\mathrm{~d}_{\text {draw }}=\frac{2}{49 \cdot \mu_{\mathrm{s}} \cdot g} \cdot\left(\mathrm{R} \cdot \omega_{\text {drag }}\left(\mathrm{v}, \omega, \mathrm{~d}_{\text {drag }}\right)\right)^{2}+\frac{1}{2 \cdot \mu_{\mathrm{r}} \cdot g} \cdot\left(\frac{2}{7} \mathrm{R} \cdot \omega_{\text {drag }}\left(\mathrm{v}, \omega, \mathrm{~d}_{\mathrm{drag}}\right)\right)^{2} \\
\mathrm{~d}_{\text {draw }}=\frac{2 \mathrm{R}^{2}}{49 \mathrm{~g}}\left(\frac{1}{\mu_{\mathrm{s}}}+\frac{1}{\mu_{\mathrm{r}}}\right) \cdot \omega_{\text {drag }}\left(\mathrm{v}, \omega, \mathrm{~d}_{\mathrm{drag}}\right)^{2} \\
\mathrm{~d}_{\text {draw }}=\frac{2 \mathrm{R}^{2}}{49 \mathrm{~g}}\left(\frac{1}{\mu_{\mathrm{s}}}+\frac{1}{\mu_{\mathrm{r}}}\right) \cdot\left[\omega+\frac{5}{2 \cdot \mathrm{R}} \cdot\left(\mathrm{v}-\sqrt{\mathrm{v}^{2}-2 \cdot \mu_{\mathrm{s}} \cdot g \cdot \mathrm{~d}_{\mathrm{drag}}}\right)\right]^{2}
\end{gathered}
$$

To account for energy loss in the tip-ball collision, we can use the following equations for ball speed and spin instead (from TP A.30), which account for tip inefficiency:

$$
\begin{gathered}
\eta:=0.87 \quad \text { typical cue tip efficiency } \\
\mathrm{v}_{\mathrm{m}}\left(\mathrm{v}_{\mathrm{s}}, \mathrm{~b}\right):=\mathrm{v}_{\mathrm{s}} \cdot \frac{1+\sqrt{\eta-\frac{1-\eta}{\mathrm{m}_{\mathrm{r}}} \cdot\left[1+\frac{5}{2} \cdot\left(\frac{\mathrm{~b}}{\mathrm{R}}\right)^{2}\right]}}{\left[1+\mathrm{m}_{\mathrm{r}}+\frac{5}{2} \cdot\left(\frac{\mathrm{~b}}{\mathrm{R}}\right)^{2}\right]} \\
\mathrm{m}_{\mathrm{w}}\left(\mathrm{v}_{\mathrm{s}}, \mathrm{~b}\right):=-\frac{5}{2} \cdot \mathrm{v}\left(\mathrm{v}_{\mathrm{s}}, \mathrm{~b}\right) \cdot \frac{\mathrm{b}}{\mathrm{R}^{2}}
\end{gathered}
$$

Here is how the cue ball speed varies with tip offset for a given cue speed, accounting for tip inefficiency:

So with a center-ball hit, and a typical tip inefficiency, the CB speed is about $30 \%$ more than the cue speed; and at a maximum tip offset shot, the CB speed is about $75 \%$ (3/4) of the original cue speed.

Here is how the cue ball spin varies with tip offset for a given cue speed:

So, with a typical tip inefficiency, more tip offset gives you more spin, but the increase in spin isn't as great with increasing offset. The spin at maximum offset is only about $35 \%$ faster than the spin at half the maximum offset. Also, the spin at $90 \%$ offset is nearly equal to the spin at maximum (100\%) offset.

To account for ball inelasticity, from TP A. 5 (Equation 7),

$$
\mathrm{v}^{\prime \prime}=\frac{\left(1-\mathrm{e}_{\mathrm{b}}\right)}{2} \cdot \mathrm{v}^{\prime}
$$

and to account for ball friction, from 7 D ^ $\cap 7$

$$
\begin{gathered}
\mu(\mathrm{v}):=9.951 \cdot 10^{-3}+0.108 \cdot \mathrm{e} \cdot \frac{-1.088 \cdot \frac{\mathrm{v}}{\frac{\mathrm{~m}}{\mathrm{~s}}}}{\mathrm{v}_{\mathrm{rel}}\left(\mathrm{v}, \omega_{\mathrm{X}}, \omega_{\mathrm{Z}}, \phi\right):=\sqrt{\left(\mathrm{v} \cdot \sin (\phi)-\mathrm{R} \cdot \omega_{\mathrm{z}}\right)^{2}+\left(\mathrm{R} \cdot \omega_{\mathrm{x}} \cdot \cos (\phi)\right)^{2}}} \\
\tan \theta\left(\mathrm{v}, \omega_{\mathrm{x}}, \omega_{\mathrm{z}}, \phi\right):=\frac{\min \left(\frac{\mu\left(\mathrm{v}_{\mathrm{rel}}\left(\mathrm{v}, \omega_{\mathrm{x}}, \omega_{\mathrm{z}}, \phi\right)\right) \cdot \mathrm{v} \cdot \cos (\phi)}{\mathrm{v}_{\mathrm{rel}}\left(\mathrm{v}, \omega_{\mathrm{x}}, \omega_{\mathrm{Z}}, \phi\right)}, \frac{1}{\mathrm{v}}\right) \cdot\left(\mathrm{v} \cdot \sin (\phi)-\mathrm{R} \cdot \omega_{\mathrm{z}}\right)}{\mathrm{v} \cdot \cos (\phi)} \\
\Delta \omega\left(\mathrm{v}, \omega_{\mathrm{x}}, \omega_{\mathrm{z}}, \phi\right):=\frac{5}{2} \cdot \frac{\mathrm{v}}{\mathrm{R}} \cdot \tan \theta\left(\mathrm{v}, \omega_{\mathrm{x}}, \omega_{\mathrm{Z}}, \phi\right)
\end{gathered}
$$

where $\Delta \omega$ is the change in spin experienced by both the CB and OB .

With this analysis, topspin in analogous to sidespin in TP A.27, and the throw is in the vertical direction. Therefore,

$$
\begin{array}{clc}
\phi:=0 & \omega_{\mathrm{Z}}=\omega^{\prime} & \omega_{\mathrm{x}}:=0 \\
\text { no cut angle } & \text { (topspin) } & \text { no sidespin (English) }
\end{array}
$$

With topspin, $\omega_{z}>0$ and $\Delta \omega<0$. With bottomspin, $\omega_{z}<0$ and $\Delta \omega>0$.
For a follow shot, the CB spin, after impact, is:

$$
\omega^{\prime \prime}=\omega^{\prime}+\Delta \omega
$$

For a draw shot, the CB spin, after impact, is:

$$
\omega^{\prime \prime}=-\left(\omega^{\prime}+\Delta \omega\right)
$$

Now let's see how draw distance varies with cue speed, tip offset, shot distance, and table conditions. The following program calculates the draw distance for any case, and accounts for imperfect balls and an imperfect tip.

$$
\begin{aligned}
& \mathrm{d}_{\text {draw }}\left(\mathrm{v}_{\mathrm{s}}, \mathrm{~b}, \mathrm{~d}_{\text {drag }}, \mu_{\mathrm{s}}, \mu_{\mathrm{r}}\right):=\left\lvert\, \begin{array}{l}
\mathrm{v} \leftarrow \mathrm{v}\left(\mathrm{v}_{\mathrm{s}}, \mathrm{~b}\right) \\
\omega \leftarrow \omega\left(\mathrm{v}_{\mathrm{S}}, \mathrm{~b}\right) \\
\mathrm{d}_{\text {stun }} \leftarrow \mathrm{d}_{\text {stun }}\left(\mathrm{v}, \omega, \mu_{\mathrm{s}}\right)
\end{array}\right. \\
& \text { if }\left(d_{\text {stun }}<d_{d r a g}\right) \\
& \text { "CB hits OB with topspin" } \\
& \mathrm{d}_{\text {pre_roll }} \leftarrow \mathrm{d}_{\text {skid }}\left(\mathrm{v}, \omega, \mu_{\mathrm{s}}\right) \\
& \text { if }\left(\mathrm{d}_{\text {pre_roll }}<\mathrm{d}_{\text {drag }}\right) \\
& \text { | "CB rolls before OB contact" } \\
& \mathrm{v}_{\text {pre_roll }} \leftarrow \mathrm{v}_{\text {skid }}(\mathrm{v}, \omega) \\
& \text { d_roll_stop } \leftarrow \mathrm{d}_{\text {roll }}\left(\mathrm{v}_{\text {pre_roll }}, \mu_{\mathrm{r}}\right) \\
& \text { if }\left[\text { d_roll_stop }<\left(\mathrm{d}_{\text {drag }}-\mathrm{d}_{\text {pre_roll }}\right)\right] \\
& \left\lvert\, \begin{array}{l}
\text { "CB doesn't reach } \mathrm{OB} " \\
\mathrm{v} ' \leftarrow 0
\end{array}\right. \\
& \text { otherwise } \\
& \left\lvert\, \begin{array}{l}
\text { "CB rolls into OB" } \\
\mathrm{v}^{\prime} \leftarrow \mathrm{v}_{\text {roll }}\left[\mathrm{v}_{\text {pre_roll }},\left(\mathrm{d}_{\text {drag }}-\mathrm{d}_{\text {pre_roll }}\right), \mu_{\mathrm{r}}\right]
\end{array}\right. \\
& \omega^{\prime} \leftarrow \frac{\mathrm{v}^{\prime}}{\mathrm{R}} \\
& \text { otherwise } \\
& \text { | "CB slides into OB with partial roll" } \\
& \omega^{\prime} \leftarrow \omega_{\text {drag }}\left(\mathrm{v}, \omega, \mathrm{~d}_{\mathrm{drag}}, \mu_{\mathrm{s}}\right) \\
& \mathrm{v}^{\prime} \leftarrow \mathrm{v}_{\mathrm{drag}}\left(\mathrm{v}, \mathrm{~d}_{\mathrm{drag}}, \mu_{\mathrm{s}}\right) \\
& \mathrm{v}^{\prime \prime} \leftarrow \frac{\left(1-\mathrm{e}_{\mathrm{b}}\right)}{2} \cdot \mathrm{v}^{\prime} \\
& \omega^{\prime \prime} \leftarrow-\left(\omega^{\prime}+\Delta \omega\left(\mathrm{v}^{\prime}, 0, \omega^{\prime}, 0\right)\right) \\
& \mathrm{v}^{\prime \prime} \leftarrow \mathrm{v}_{\text {skid }}\left(\mathrm{v}^{\prime \prime},-\omega^{\prime \prime}\right) \\
& \mathrm{d}_{\text {draw }} \leftarrow-\left(\mathrm{d}_{\text {skid }}\left(\mathrm{v}^{\prime},-\omega ", \mu_{\mathrm{s}}\right)+\mathrm{d}_{\text {roll }}\left(\mathrm{v}^{\prime \prime}, \mu_{\mathrm{r}}\right)\right)
\end{aligned}
$$

$$
\begin{aligned}
& \text { otherwise } \\
& \left\lvert\, \begin{array}{l}
\text { CB hits OB with backspin" } \\
\mathrm{v}^{\prime} \leftarrow \mathrm{v}_{\text {drag }}\left(\mathrm{v}, \mathrm{~d}_{\text {drag }}, \mu_{\mathrm{s}}\right) \\
\omega^{\prime} \leftarrow \omega_{\text {drag }}\left(\mathrm{v}, \omega, \mathrm{~d}_{\text {drag }}, \mu_{\mathrm{s}}\right) \\
\omega^{\prime \prime} \leftarrow-\left(\omega^{\prime}+\Delta \omega\left(\mathrm{v}^{\prime}, 0, \omega^{\prime}, 0\right)\right) \\
\mathrm{v}^{\prime \prime} \leftarrow \frac{\left(1-\mathrm{e}_{\mathrm{b}}\right)}{2} \cdot \mathrm{v}^{\prime} \\
\mathrm{v}^{\prime \prime \prime} \leftarrow \mathrm{v}_{\text {skid }}\left(-\mathrm{v}^{\prime \prime}, \omega^{\prime \prime}\right) \\
\mathrm{d}_{\text {draw }} \leftarrow \mathrm{d}_{\text {skid }}\left(-\mathrm{v}^{\prime \prime}, \omega^{\prime \prime}, \mu_{\mathrm{s}}\right)+\mathrm{d}_{\text {roll }}\left(\mathrm{v}^{\prime \prime \prime}, \mu_{\mathrm{r}}\right)
\end{array}\right.
\end{aligned}
$$

Typical shot distances:

$$
\mathrm{d}_{\text {drag_short }}:=1 \cdot \mathrm{ft} \quad \mathrm{~d}_{\text {drag_medium }}:=4 \cdot \mathrm{ft} \quad \mathrm{~d}_{\text {drag_long }}:=8 \cdot \mathrm{ft}
$$

Valid range of tip offset (for no miscue): $\quad \mathrm{b}:=0 \cdot \mathrm{in}, \frac{\mathrm{b}_{\text {max }}}{50} . . \mathrm{b}_{\text {max }}$

NOTE - In all of the plots below, a negative $d_{d r a w}$ implies follow and a zero implies a stop shot or the CB not making it to the OB.

## Draw distance vs. tip offset for various cue speeds:

$\mathrm{d}_{\text {drag }}:=\mathrm{d}_{\text {drag_short }}$

A

${ }_{\text {d dxage }}:=\mathrm{d}_{\text {drag_medium }}$
${ }_{\text {madrage }}:=d_{\text {drag_long }}$

Draw distance vs. tip offset for various shot (drag) distances:
$\mathrm{v}_{\text {siv }}=\mathrm{v}_{\mathrm{S}_{\text {_s }}}$ slow

D

$\mathrm{M}_{\mathrm{M}} \mathrm{vi}=\mathrm{v}_{\mathrm{S} \text { _medium }}$

$$
\mathrm{N}_{\text {Niv }}:=\mathrm{v}_{\mathrm{s}_{-} \mathrm{fast}}
$$

$$
{\underset{\mathrm{m}}{\mathrm{Vi}}}^{\mathrm{V}}=\mathrm{v}_{\mathrm{S} \_ \text {power }}
$$

G

## Sensitivity analysis for cue speed and tip offset for various draw distances:

$$
\underset{\text { mdraga }}{\mathrm{d}}:=\mathrm{d}_{\text {drag_medium }} \quad \mathrm{b}:=0,0.5 \% \cdot \mathrm{~b}_{\max } . .50 . \% \mathrm{~b}_{\max }
$$

$$
\mathrm{b}_{\text {small }}:=25 \% \cdot \mathrm{~b}_{\max } \quad \mathrm{b}_{\text {medium }}:=50 \% \cdot \mathrm{~b}_{\max } \quad \mathrm{b}_{\text {large }}:=100 \cdot \% \cdot \mathrm{~b}_{\max }
$$

$$
\begin{array}{lll}
\mathrm{v}_{1}:=0.75 \cdot \mathrm{v}_{\mathrm{s} \_ \text {fast }} & \mathrm{v}_{2}:=\mathrm{v}_{\mathrm{s} \_ \text {fast }} & \mathrm{v}_{3}:=1.25 \cdot \mathrm{v}_{\mathrm{s} \_\mathrm{fast}} \\
\mathrm{~b}_{1}:=24.6 \% \cdot \mathrm{~b}_{\text {max }} & \mathrm{b}_{2}:=14.5 \% \cdot \mathrm{~b}_{\max } & \mathrm{b}_{3}:=10 \% \cdot \mathrm{~b}_{\max }
\end{array}
$$

stun-through (roll through) stun-follow shot:

$$
{ }_{\text {mdkagg }}^{\mathrm{d}}:=1.5 \cdot \mathrm{ft}, 1.51 \cdot \mathrm{ft} . .2 .5 \cdot \mathrm{ft}
$$

stun-back (roll back)
stun-draw shot:

$$
\mathrm{b}_{\mathrm{mn}}:=12.5 \% \cdot \mathrm{~b}_{\max } \quad \quad \mathrm{b}_{22}:=5.9 \% \cdot \mathrm{~b}_{\max } \quad \quad \mathrm{b}_{3}:=3.2 \% \cdot \mathrm{~b}_{\max }
$$

stop shot:

Let's look at how draw distance varies with shot distance, speed, and tip offset for a fairly powerful draw shot, where the OB is 6 feet away and you want to draw the CB 6 feet back to its original location:

$$
\begin{aligned}
& \mathrm{d}_{\mathrm{drag}}:=6 \cdot \mathrm{ft} \quad \quad \mathrm{~d}_{\text {dкхаg }}:=0.75 \cdot \mathrm{~d}_{\text {drag }}, 0.76 \cdot \mathrm{~d}_{\text {drag }} .1 .25 \cdot \mathrm{~d}_{\mathrm{drag}} \\
& \mathrm{~V}_{12}:=11.65 \cdot \mathrm{mph} \mathrm{~V}_{2}:=11.25 \cdot \mathrm{mph} \quad \mathrm{~V}_{2}:=11.1 \cdot \mathrm{mph} \quad \mathrm{v}_{4}:=12.42 \cdot \mathrm{mph} \\
& \mathrm{~b}_{1}:=\mathrm{b}_{\max } \quad \mathrm{b}_{2 \pi}:=.9 \cdot \mathrm{~b}_{\max } \quad \mathrm{b}_{3}:=.75 \cdot \mathrm{~b}_{\max } \quad \mathrm{b}_{4}:=.5 \cdot \mathrm{~b}_{\max }
\end{aligned}
$$

$\mathrm{d}_{\mathrm{drag}}:=6 \cdot \mathrm{ft} \quad \mathrm{b}:=0,0.5 \% \cdot \mathrm{~b}_{\max } \cdot .100 \cdot \% \mathrm{~b}_{\max }$

Let's look at how draw distance varies with shot distance, speed, and tip offset for an example draw shot, where the OB is 9 feet away and you want to draw the CB the equivalent of 18 feet back:

$$
\begin{aligned}
& { }_{\text {Mdragg }}^{\mathrm{d}}=9 \cdot \mathrm{ft} \quad \quad \stackrel{\mathrm{~d}}{\text { Mdкag: }}:=0.75 \cdot \mathrm{~d}_{\text {drag }}, 0.76 \cdot \mathrm{~d}_{\text {drag }} .1 .25 \cdot \mathrm{~d}_{\text {drag }}
\end{aligned}
$$

Let's look at how draw distance varies with shot distance, speed, and tip offset for a more modest draw shot, where the OB is 3 feet away and you want to draw the CB 3 feet back to its original location:

$$
\begin{aligned}
& \mathrm{b}_{\text {ma }}:=\mathrm{b}_{\max } \quad \mathrm{b}_{\text {man }}:=.9 \cdot \mathrm{~b}_{\max } \quad \mathrm{b}_{\text {mai }}:=.75 \cdot \mathrm{~b}_{\max } \quad \mathrm{b}_{\text {an }}:=.5 \cdot \mathrm{~b}_{\max }
\end{aligned}
$$

$d_{\text {drag }}:=3 \cdot \mathrm{ft} \quad \mathrm{b}:=0,0.5 \% \cdot \mathrm{~b}_{\text {max }} . \cdots 100 \% \mathrm{~b}_{\text {max }}$

U

$$
\frac{\mathrm{d}_{\mathrm{draw}}\left(\mathrm{v}_{1}, \mathrm{~b}, \mathrm{~d}_{\mathrm{drag}}, \mu_{\mathrm{s}}, \mu_{\mathrm{r}}\right)}{\mathrm{d}_{\mathrm{draw}}\left(\mathrm{v}_{4}, \mathrm{~b}, \mathrm{~d}_{\mathrm{drag}}, \mu_{\mathrm{S}}, \mu_{\mathrm{r}}\right)} \mathrm{ft}_{5}
$$

## Now let's look at the effects of cloth conditions (a sticky cloth vs. a slick cloth):

$$
\begin{aligned}
& \mu_{\text {s_slick }}:=0.1 \quad \mu_{\text {s_sticky }}:=0.3 \\
& \mathrm{v}_{\mathrm{s} 1}:=10 \cdot \mathrm{mph} \quad \mathrm{v}_{\mathrm{s} 2}:=15 \cdot \mathrm{mph} \\
& \mathrm{~b}_{4}:=36.6 \% \cdot \mathrm{~b}_{\max } \quad \mathrm{b}_{2}:=80 \% \cdot \mathrm{~b}_{\max } \quad \mathrm{b}_{32}:=22.9 \% \cdot \mathrm{~b}_{\max } \quad \mathrm{b}_{\text {din }^{2}}:=30.1 \% \cdot \mathrm{~b}_{\max }
\end{aligned}
$$

## Optimal tip offset for maximum draw for different speeds and drag distances:

$$
\begin{gathered}
\left.\mathrm{v}_{\mathrm{s}}:=\mathrm{v}_{\mathrm{S} \_ \text {power }} \quad \mathrm{d}_{\text {drag }}:=\mathrm{d}_{\text {drag_long }} \quad \mathrm{b}:=.75 \cdot \mathrm{~b}_{\text {max }} \text { (initial guess }\right) \\
\mathrm{b} \_ \text {opt }(\mathrm{b}):=\mathrm{d}_{\text {draw }}\left(\mathrm{v}_{\mathrm{s}}, \mathrm{~b}, \mathrm{~d}_{\text {drag }}, \mu_{\mathrm{s}}, \mu_{\mathrm{r}}\right)
\end{gathered}
$$

Given

$$
\begin{aligned}
& \mathrm{b}>0 \\
& \mathrm{~b}<\mathrm{b}_{\text {max }}
\end{aligned}
$$

$$
\text { boopt:= Maximize(b_opt,b) }=0.436 \cdot \text { in }
$$

$$
\frac{\mathrm{b}_{\text {_opt }}}{\mathrm{b}_{\text {max }}}=77.48 . \% \quad \mathrm{~d}_{\text {draw }}\left(\mathrm{v}_{\mathrm{s}}, \mathrm{~b}_{\mathrm{o}} \mathrm{opt}, \mathrm{~d}_{\text {drag }}, \mu_{\mathrm{s}}, \mu_{\mathrm{r}}\right)=6.84 \cdot \mathrm{ft}
$$

Here are some example values:

| $\mathrm{v}_{\text {S_slow }}=5.263 \cdot \mathrm{mph}$ | $\mathrm{d}_{\text {drag_short }}=1 \cdot \mathrm{ft}$ | b opt $:=82.3 \%$ | d_draw := 2.6ft |
| :---: | :---: | :---: | :---: |
| $\mathrm{v}_{\text {S_medium }}=6.579 \cdot \mathrm{mph}$ | $\mathrm{d}_{\text {drag_short }}=1 \cdot \mathrm{ft}$ | b opt $:=87.7 \%$ | d draw $=6.2 \mathrm{ft}$ |
| $\mathrm{v}_{\text {S_fast }}=9.211 \cdot \mathrm{mph}$ | $\mathrm{d}_{\text {drag_short }}=1 \cdot \mathrm{ft}$ | b opt $:=92.7 \%$ | d draw : $=16.2 \mathrm{ft}$ |
| $\mathrm{v}_{\text {s_power }}=12.5 \cdot \mathrm{mph}$ | $\mathrm{d}_{\text {drag_short }}=1 \cdot \mathrm{ft}$ | b opt $:=95.2 \%$ | d draw : $=33.9 \mathrm{ft}$ |
| $\mathrm{v}_{\text {s_medium }}=6.579 \cdot \mathrm{mph}$ | $\mathrm{d}_{\text {drag_medium }}=4 \cdot \mathrm{ft}$ | b opt $:=61.8 \%$ | d draw $=0.0 \mathrm{ft}$ |
| $\mathrm{v}_{\text {S_fast }}=9.211 \cdot \mathrm{mph}$ | $\mathrm{d}_{\text {drag_medium }}=4 \cdot \mathrm{ft}$ | b opt $:=77.9 \%$ | d draw : $=5.3 \mathrm{ft}$ |
| $\mathrm{v}_{\text {s_power }}=12.5 \cdot \mathrm{mph}$ | $\mathrm{d}_{\text {drag_medium }}=4 \cdot \mathrm{ft}$ | b opt $:=87.7 \%$ | d draw : $=24.6 \mathrm{ft}$ |
| $\mathrm{v}_{\text {S_fast }}=9.211 \cdot \mathrm{mph}$ | $\mathrm{d}_{\text {drag_long }}=8 . \mathrm{ft}$ | b opt $=$ = 61.1\% | d draw $=0.0 \mathrm{ft}$ |
| $\mathrm{v}_{\text {s_power }}=12.5 \cdot \mathrm{mph}$ | $\mathrm{d}_{\text {drag_long }}=8 . \mathrm{ft}$ | b opt $:=76.3 \%$ | ${ }_{\text {d draw }}$ dra $=8.1 \mathrm{ft}$ |

## Useful conclusions from all of the plots above, which are consistent with generally accepted "best practices" and good-player intuition:

1. Generally, to get more draw, you must hit the cue ball harder and lower (see graphs A and G). No big surprise here!
2. More tip offset does not produce significantly more draw as you approach the miscue limit; so, generally, it is advisable to not hit too close to the miscue limit (see graphs A and G).
3. With larger drag distances, and for a given maximum cue speed, max draw occurs at less than maximum tip offset (at about $70 \%-80 \%$ tip offset). In other words, you don't get more power draw by hitting closer to the miscue limit (see Graphs G, Q, S, and U, and see the data on the previous page).
4. In general, with a draw shot with a medium desired draw distance, a slower cue speed with more tip offset will result in better draw distance control than a faster cue speed with less offset (see the slopes of the curves in Graphs A and G at a given draw distance).
5. Stop shots are much less sensitive to tip offset position than draw shots are. In other words, CB position is much easier to control with a stop shot, as compared to a draw shot (see Graphs G, H, I, N, and O).
6. For a short stop shot, slower speed offers slightly better control (see the overall slopes of the curves in Graph I). For longer stop shots, faster speed appears to offer slightly better control (see Graphs N and O ).
7. For stun-through (small controlled follow) and stun-back (small controlled draw), a firmer hit closer to center offers better CB control (see Graphs L and M).
8. It is much easier to control draw distance on a new, slick cloth than it is on a "sticky" cloth, especially with lower-speed shots (see Graph T). The statement assumes the player is equally well "adjusted" to each cloth condition. Any player will need to adjust when playing under different cloth conditions.
9. It is easier to draw the ball on slick cloth, and faster cloth allows for greater draw distances.
